ART UNIT PAPER NUMBER

1773

DATE MAILED: 09/13/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

10/647,523

Applicant(s)

JING ET AL.

Examiner

Ramsey Zacharia

Art Unit

1773

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 08 July 2005.
2a) ☒ This action is FINAL. 2b) ☐ This action is non-final.
3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 2-20 is/are pending in the application.
4a) Of the above claim(s) _____ is/are withdrawn from consideration.
5) ☐ Claim(s) _____ is/are allowed.
6) ☒ Claim(s) 2-20 is/are rejected.
7) ☐ Claim(s) _____ is/are objected to.
8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
10) ☒ The drawing(s) filed on 25 August 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____.
4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____.
5) ☐ Notice of Informal Patent Application (PTO-152)
6) ☐ Other: _____.

DETAILED ACTION

1. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claim Rejections - 35 USC § 112

2. Claim 18 is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. This is a new matter rejection. No support could be found in the disclosure as originally filed for the limitation that the fluoropolymer surface is "substantially free of fluorosurfactant." The courts have held that the addition of a negative limitation which did not appear in the disclosure as originally filed introduces a new concept and violates the description requirement of 35 U.S.C. 112. *Ex parte Grasselli* 231 USPQ 393.

3. Claims 2-17, 19, and 20 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

4. Claims 2-17, 19, and 20 recite two limitations that are seemingly incompatible with one another. Independent claim 20 requires: (1) that the surface of the substrate is in contact with the surface of the fluoropolymer, and (2) that one or both of the surfaces are treated with a bonding

Art Unit: 1773

composition. Independent claim 17 requires: (1) the surface of the fluoropolymer to be bonded directly to the surface of the substrate, and (2) the utilization of a bonding composition. It is impossible for two surfaces to be in contact with or directly bonded to one another if a bonding composition is interposed between the substrates; the substrates are either in contact with each other or they are in contact with the bonding composition. If a bonding composition is interposed between the two surfaces, then the surface will not be bonded directly together and will not be in contact with each other. Conversely, if the surfaces are directly bonded together and in contact with one another, then nothing can be interposed between the two surfaces.

Claim Language

5. For the purpose of examination, the surfaces of both the fluoropolymer and the substrate are taken to be in direct contact with the bonding composition.

Claim Rejections - 35 USC § 102

6. Claims 3, 6-8, 13, 16, 17, and 20 are rejected under 35 U.S.C. 102(b) as being anticipated by Stoeppelmann (U.S. Patent 5,869,157).

Stoeppelmann teaches an article comprising a fluoropolymer layer, a polyamide layer, and a layer of an adhesion promoter (column 2, lines 33-50). The adhesion promoter comprises a polyamide and a diamine that may be a substituted or unsubstituted aliphatic diamine (column 2, lines 53-65). The diamine corresponds to the electron donor of the instant claims. The polyamide corresponds to the light-absorbing compound since it is capable of absorbing at least some light and the claims do not require a degree of absorption or wavelength(s) at which the

Art Unit: 1773

absorption occurs. The fluoropolymer is a polymer comprising vinylidene fluoride, i.e. it is partially fluorinated (column 4, lines 27-30). In the embodiments of Examples 3 and 4, both the fluoropolymer and the polyamide layers are in direct contact with the adhesion promoter.

7. Claims 2-4, 6, 12-17, 19, and 20 are rejected under 35 U.S.C. 102(b) as being anticipated by Nishii et al. (U.S. Patent 5,470,617).

Nishii et al. teach modifying the surface of a fluoropolymer by irradiating the surface in the presence of a UV-absorbing compound and a fluorosurfactant to improve adhesion (column 2, lines 15-30). The fluoropolymer may be perfluorinated or partially fluorinated (column 2, lines 35-47). The UV-absorbing compound may be an aromatic amine, i.e. an electron donor (column 2, lines 54-60). The fluorosurfactant may be an ammonium compound (column 3, lines 50-60), which would read on the light-absorbing compound in the instant claims. The treated fluoropolymer may be adhered to other resins or inorganic materials (column 5, lines 54-67). In the embodiment of Example 1, the article comprises (in order): a fluoropolymer, the applied surface modifying composition, an epoxy layer, and a steel layer. The fluoropolymer reads on fluoropolymer having a surface, the applied surface modifying composition reads on the bonding composition, and the epoxy and steel layers read on a substrate that is both in contact with the applied surface modifying composition and also includes metal. It is noted that the instant specification does not require the substrate to be monolithic but explicitly permits the substrate to be an organic-inorganic composite (see page 7, lines 22-24). Moreover, a substrate that "includes" an inorganic substrate encompasses an organic-inorganic composite substrate.

Art Unit: 1773

8. Claims 3, 6, 7, 10, 13-15, and 20 are rejected under 35 U.S.C. 102(b) as being anticipated by Vasta (U.S. Patent 4,495,247).

Vasta teaches a primer composition that has excellent adhesion to a variety of substrates and to which fluoropolymer coating compositions will adhere (column 1, lines 24-28). The primer composition comprises a fluorocarbon polymer, a metallic oxide, a pigment, and an amino alkyl alkoxy silane (column 1, lines 30-41). The silane corresponds to the electron donor of the instant claims. The fluorocarbon polymer, metallic oxide, and/or pigment correspond(s) to the light-absorbing compound since they are all capable of absorbing at least some light and the claims do not require a degree of absorption or wavelength(s) at which the absorption occurs. The primer may be applied over a metal substrate (column 2, lines 56-61). In the embodiment of Example 1, a partially fluorinated polymer is used as the fluoropolymer coating and both the fluoropolymer and metal substrate are in contact with the primer layer (column 3, lines 46-63).

9. Claims 3, 6, 8, 12, 14, 15, and 20 are rejected under 35 U.S.C. 102(b) as being anticipated by Tannenbaum (U.S. Patent 5,562,991).

Tannenbaum teaches a primer layer for a non-stick coating that comprises a polymeric binder, a fluoropolymer, and an inorganic filler (column 2, lines 38-44). The primer may be applied to inorganic substrates such as metal and glass (column 2, lines 61-67). The invention also includes a composite structure comprising the primer between the substrate surface and an overcoat of fluoropolymer (column 3, lines 8-12). In one formulation, the binder comprises polyamic acid, triethylene amine, and both black and blue pigments (column 7, lines 56-column 8, line 10). In addition to the amine, polyamic acid also comprises amine groups, therefore they

all reads on the electron donor of the instant claims. Black and blue pigments are light absorbing compounds. The non-stick coating comprises PTFE and PFA (column 7, lines 45-55).

Claim Rejections - 35 USC § 102 / 103

10. Claims 18 and 19 are rejected under 35 U.S.C. 102(b) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Stoeppelmann (U.S. Patent 5,869,157).

Stoeppelmann teaches all the limitations of claims 18 and 19, as outlined above, except for the exposing the adhesion promoter to actinic radiation. However, this is a product-by-process type of limitation.

The determination of patentability for a product-by-process claim is based on the product itself and not on the method of production. If the product in the product-by-process claim is the same or obvious from a product of the prior art, the claim is unpatentable even though the prior product was made by a different process. Thus, when the prior art discloses a product which reasonably appears to be either identical with or only slightly different than a product claim in a product-by-process claim, the burden is on the applicant to present evidence from which the examiner could reasonably conclude that the claimed product differs in kind from those of the prior art. See MPEP § 2113. In this case, since the composition of the adhesion promoter reads on that of instant claims 18 and 19 (a combination of an electron donor and a light-absorbing compound), and it performs the same function (improving adhesion), the burden is on the applicant to demonstrate that the product of claim 18 differs from that of the prior art.

Art Unit: 1773

11. Claim 19 is rejected under 35 U.S.C. 102(b) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Vasta (U.S. Patent 4,495,247).

Vasta teaches all the limitations of claim 19, as outlined above, except for the step of exposing the adhesion promoter to actinic radiation. However, this is a product-by-process type of limitation.

Since the determination of patentability for a product-by-process claim is based on the product itself and not on the method of production and since the product of Vasta appears to be the same as that of claim 19 (a combination of an electron donor and a light-absorbing compound that improves adhesion), the burden is on the applicant to demonstrate that the product of claim 19 differs from that of the prior art.

12. Claim 19 is rejected under 35 U.S.C. 102(b) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Tannenbaum (U.S. Patent 5,562,991).

Tannenbaum teaches all the limitations of claim 19, as outlined above, except for the step of exposing the adhesion promoter to actinic radiation. However, this is a product-by-process type of limitation.

Since the determination of patentability for a product-by-process claim is based on the product itself and not on the method of production and since the product of Tannenbaum appears to be the same as that of claim 19 (a combination of an electron donor and a light-absorbing compound that improves adhesion), the burden is on the applicant to demonstrate that the product of claim 19 differs from that of the prior art.

Claim Rejections - 35 USC § 103

13. Claim 9 is rejected under 35 U.S.C. 103(a) as being unpatentable over Stoeppelmann (U.S. Patent 5,869,157).

Stoeppelmann teaches an adhesion promoter that satisfies all the limitations of claim 9, as outlined above, except that the diamine is fluoroalkylamine.

However, Stoeppelmann do teach that the diamine may be a substituted or unsubstituted aliphatic diamine and the composition is designed to promote adhesion to a fluorinated polymer.

One of ordinary skill in the art would be motivated to use a diamine having a fluorine substituted aliphatic group to further enhance adhesion by making the diamine more compatible with the fluoropolymer to which it is to be applied.

14. Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over Stoeppelmann (U.S. Patent 5,869,157) in view of Gillham et al. (U.S. Patent 3,309,425).

Stoeppelmann teaches all the limitations of claim 5, as outlined above, except for the inclusion of a phosphonium compound into the adhesion promoting layer. However, Stoeppelmann do teach that a variety of additives, including flame retardants, may be added to the adhesion promoter composition (column 3, lines 51-55).

Gillham et al. teach phosphonium compounds that are used as flame retardants in thermoplastic resin systems (column 1, lines 10-34). The compounds may be added in relatively small amounts and do not crystallize or oil out of the polymer system to which they are added (column 1, lines 35-53).

Art Unit: 1773

One of ordinary skill in the art would be motivated to use a phosphonium compound described by Gillham et al. as the flame retardant because only a small amount is required and it will not crystallize or oil out of the polymer. Since the phosphonium compound would absorb light, it would read on a light-absorbing compound when added to the composition.

15. Claim 11 is rejected under 35 U.S.C. 103(a) as being unpatentable over Tannenbaum (U.S. Patent 5,562,991) in view of Friedman et al. (U.S. Patent 5,908,704)

Tannenbaum teaches all the limitations of claim 11, as outlined above, except Tannenbaum does not include a vinyl silane in their primer composition. However, the primer is applied to glass and is designed to promote adhesion between the glass and a fluoropolymer.

Friedman et al. disclose the addition of a vinyl silane coupling agent to a fluoropolymer containing interlayer to improve the adhesion of the layer to a glass substrate (column 4, lines 35-48).

One of ordinary skill in the art would be motivated to add a vinyl silane to the primer composition of Tannenbaum to improve its adhesion to glass.

Double Patenting

16. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground

Art Unit: 1773

provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

17. Claim 18 is rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claim 29 of U.S. Patent No. 6,752,894. Although the conflicting claims are not identical, they are not patentably distinct from each other because the invention of instant claim 18 represents a genus of which the invention described by claim 29 of U.S. Patent No. 6,752,894 is a species. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993). The "inorganic photochemical electron donor" recited in claim 29 of U.S. Patent No. 6,752,894 is a species of the "electron donor" in instant claim 18. The "cationic assistant" is a species of the "light-absorbing compound" in instant claim 18, particularly in view of claim 31 of U.S. Patent No. 6,752,894 and the fact that, since instant claim 18 does not require a degree of absorption or wavelength(s) at which the absorption occurs, any compound will read on "light-absorbing compound" because any compound will absorb at least some light.

Response to Arguments

18. Applicants' arguments filed 08 July 2005 have been fully considered but they are not persuasive.

112, First Paragraph

The applicants argue that the negative limitation "substantially free of fluorosurfactant" is not new matter but that the present application reasonably conveys to one skilled in the art that the inventors had possession of the invention defined by claim 18. None of the examples cite the

Art Unit: 1773

use of a fluorosurfactant and a fluorosurfactant is not cited among the examples of other additives that may be used. Failing to see any mention of the use of fluorosurfactants in the specification, it is argued that one skilled in the art would readily appreciate that the application had possession of the concept of a fluoropolymer surface that is substantially free of fluorosurfactant. The applicants have also submitted these arguments in a declaration.

This is not persuasive for the following reasons. The mere absence of a positive recitation is not basis for an exclusion. The facts of this application appear more analogous to the *Grasselli* case as opposed to the *Parks* case cited by the applicants. The applicants' invention, bonding a fluoropolymer to a substrate with a bonding composition comprising a light-absorbing compound and an electron donor, does not cry out for a fluorosurfactant, if one were used, as shown by Stoeppelmann, Vasta, and Tannenbaum, all of which bond a fluoropolymer to a substrate with a bonding composition comprising a light-absorbing compound and an electron donor. If such an invention cried out for the of a fluorosurfactant, one would have expected Stoeppelmann, Vasta, and Tannenbaum to comment, one way or the other, on the presence of a fluorosurfactant. Rather, it appears that the concept of a fluoropolymer surface that is substantially free of fluorosurfactant was not in possession of the applicants at the time of invention and its inclusion in instant claim 18 introduces a new concept that violates the description requirement of 35 USC 112.

112, Second Paragraph

The rejection under the second paragraph of 35 USC 112 is maintained because the claims still recite mutually exclusive conditions. Namely, the claims require (1) the

Art Unit: 1773

fluoropolymer and substrate to be in contact and (2) a bonding composition to be on the surface of the fluoropolymer and/or substrate. If a bonding composition is on the surface of the fluoropolymer and/or substrate, the fluoropolymer and substrate cannot be in contact with each other. On the other hand, if the surfaces of the fluoropolymer and substrate are in contact with one another, there can be no treatments on the surfaces.

Art rejections

With respect to the art rejections, the applicants argue that, in each case, the fluoropolymer surface is not in contact with and directly bonded to the substrate. However, this is not persuasive because in each case, the both the fluoropolymer and the substrate are in direct contact with a composition acting as an adhesive. Because the language of the claims is indefinite for the reasons outlined above, the language has been interpreted as meaning that the surfaces of both the fluoropolymer and the substrate are in direct contact with the bonding composition.

With respect to the rejection over Nishii et al., the applicant further argues that the epoxy resin layer is not a "substrate." The applicants cite an ASTM definition of substrate as "that which lies under; foundation" and "a material upon which an adhesive is applied." However, the epoxy resin layer of Nishii et al. qualifies as a substrate using these definitions because it lies under the fluoropolymer layer and it is a material in contact with the adhesion enhancing treatment. Moreover, the cited ASTM reference also defines "substrate" as: "a body board or layer of material on which some other active or useful material or component may be deposited or laid", "a material upon which films, treatments, adhesives, sealants, membranes, and coatings

Art Unit: 1773

are applied", and "material or object upon which something resides." Therefore, the broadest reasonable interpretation of substrate must include the epoxy resin layer of Nishii et al. since the epoxy resin layer is (1) a material on which some other active or useful material or component may be deposited or laid, (2) a material upon which films, treatments, adhesives, sealants, membranes, and coatings are applied, and (3) material or object upon which something resides. Finally, the claims as written do not require the substrate to be monolithic and the instant specification explicitly recites that the substrate may be an organic-inorganic composite (see page 7, lines 22-24) which reads on the epoxy/metal bilayer of Nishii et al.

Conclusion

19. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.
